# Innovation with vision

## WPS-BC200 2 Parkvision

**In the management office / control room of a typical parking operation you will often find several partial systems operating, including parking, intercom and security (CCTV) systems.**

Often these systems are supplied by several different companies, which can mean a lot of equipment in one room.

Parkvision, developed by WPS, integrates all of these different systems, and manages them all with one user interface. The interface consists of a depiction of the individual objects (cameras, barrier gates, intercoms etc.) that are managed on a representative map of the location. Individual components are operated with the click of the mouse or, optionally, through a touch screen. The convergence of voice, video and data information into one application allows you to reach out to your customers creating a safe and user-friendly environment.

**System integration in a typical parking operation offers the following advantages:**
- Ease of operation and efficient management of systems
- Faster transactions
- Single source supplier for all partial systems - WPS will supply, install and maintain each system

**PARKING SYSTEMS**

Imtech

Parkvision can be implemented locally in individual parking management offices, remotely at one central management office that controls several sites, or with a combination of both. Communication between local and central management offices can occur using several different transmission media depending on existing infrastructure and individual requirements. Management of a parking facility is increasingly done locally during the daytime and remotely at night. This leads to labour savings with a smaller number of people managing / operating multiple locations. Parkvision offers the opportunity to integrate your operation simply and effectively.
